

Soft Touch Brass Handles

Chisel handles are perfectly shaped and machined from solid brass. Soft corners and smooth polished surfaces make these handles gentle on the hands and of a beautiful appearance.

Durable Copper Jumpers

Our valves are machined with a smooth bore, use high grade grease and tough copper/polyurethane jumpers for extra long life.

Optional ceramic disc valves

The $\frac{3}{4}$ turn ceramic disc valves are an option with Chisel Cross tapware. The action is silky smooth and the handle opens & shuts effortlessly making this an ideal choice for the elderly or arthritic.

Thick Smooth Chroming

The Solid brass components that make up Chisel are each perfectly hand polished before being plated. Our plating consists of a thick nickel layer under the chrome to ensure that the surface is tough and shiny and will not wear through.

Concealed Handle fixing

To maintain the clean design for the Chisel handles, the handles are fixed from beneath with a concealed locking ring. This fastens firmly with a small key supplied with each Chisel tap.

Rubber Boot Seal Protection

Chisel wall taps are fitted with the unique rubber boot seal. Hidden beneath the flange, this fits over the valve body and seals against the tiles preventing splash water, that runs down the wall, from penetrating the wall cavity thus protecting it from moisture and damage.

WELS regulation compliant

Chisel Tapware complies with WELS (Water Efficiency Labelling & Standards) regulation. Star and flow rating information appears on the individual model specification page.
